Experiment 8: Change specification and use any SCM Tool to make different versions for the project

<u>Learning Objective:</u> Students will able to create versions using Github tool

Tools: Github

Theory:

Software configuration management: The traditional software configuration management (SCM) process is looked upon by practitioners as the best solution to handling changes in software projects. It identifies the functional and physical attributes of software at various points in time, and performs systematic control of changes to the identified attributes for the purpose of maintaining software integrity and traceability throughout the software development life cycle.

fu Singh Charitable Truse's

Software configuration management is a part of software engineering, which focuses mainly on maintaining, tracking and controlling the changes done to the software configuration items.

Configuration management is present in all phase of software development. The configuration items can be all the objects which come as an output of the development process e.g. coding phase produces source code, exes and obj files. The various configuration items can be:

- 1. Source code,
- 2. Documents
- 3. Data used in the programs

In Configuration management, there can be multiple versions created for any configuration item (Source code/ documents). Each version can be identified by unique configuration or an attribute which is associated with each version. E.g. the version number.

NBA and NAAC Accredited

Terminologies used in version control

- 1. SCI Software configuration items, i.e. the documents and code which will be having version number and saved.
- 2. Repository- it is the system where all the SCIs will be stored.
- 3. Check in- to store the tested and qualified source code.
- 4. Checkout- to get a copy of the stored SCI from the repository.

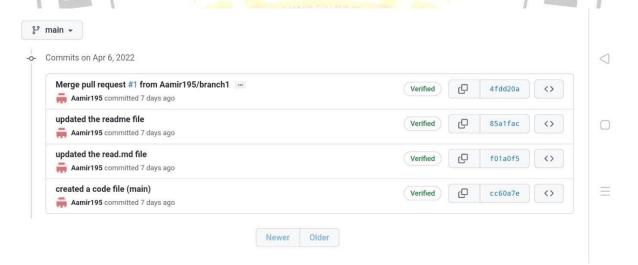

- 5. Add Add to the local repo and keep ready for commit
- 6. Commit- to save the file in repository and create a version

Advantages

- 1) The versions are stored in the repository; hence they are available as backups.
- 2) Multiple people can work simultaneously on same files/source code, without losing the changes made by other developers
- 3) It is easy to find the files with specifications as a versions are stored with version numbers

GitHub offers all of the distributed revision control and source code management (SCM) functionality of Git as well as adding its own features. Unlike Git, which is strictly a command-line tool, GitHub provides a Web-based graphical interface and desktop as well as mobile integration. It also provides access control and several collaboration features such as bug tracking, feature requests, task management for every project.

SCM for Canteen Management System:

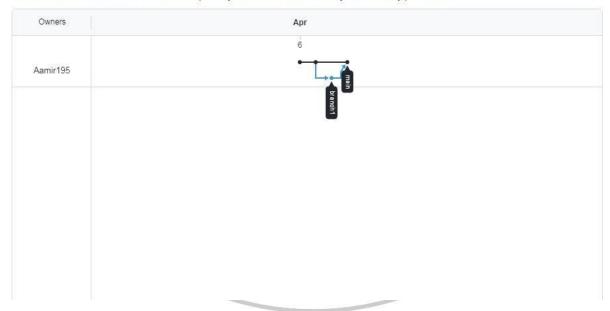

TCET DEPARTMENT OF COMPUTER ENGINEERING (COMP) (Accredited by NBA for 3 years, 3rd Cycle Accreditation w.e.f. 1rd July 2019) Choice Based Gredit Greding System with Holistic Student Development (CBCGS - H 2019) Under TCET Autonomy Scheme - 2018

Timeline of the most recent commits to this repository and its network ordered by most recently pushed to.

Learning Outcomes: Students should have the ability to

LO1: to understand the need of doing configuration management.

LO2: Identify the dissimilarity between version and variant

LO3: provide the knowledge of the benefits of using version control

LO4: To understand the types of version control system

Outcomes: Upon completion of the course students will be able to create versions for the project.

<u>Conclusion:</u> Successfully Understood SCM tool like GitHub and performed various version control methods.

Viva Ouestions:

- 1. What is difference between git and Github?
- 2. What is version control? Why is it required?
- 3. What are other tools for version control?
- 4. What are different types of version control?

For Faculty Use
